Importing drawing information is a process of converting an existing drawing into a format used by AutoCAD. General information The AutoCAD system resides on the market place of products based on the AutoCAD architectural software. AutoCAD in its simplest form consists of the system file, the AutoCAD files, a drawing file, and a drawing template, all of which are needed to create a document. The process of creating a drawing can be accomplished in the following ways: By drafting a freehand drawing in a drawing template By importing a drawing (based on a DXF file), or By importing an AutoCAD drawing, using a drawing template. There are two types of drawing templates: Snap or Drafting templates Layout templates In the case of a "standard" drawing template (sometimes called a "standard part" drawing template), the template is the type of drawing and the graphic design are used in the drawing. The dimensions of the drawing can be defined at the time of creation of the template and are not updated when a drawing is added or changed. The "standard part" drawing template can be exported as a DXF file. The other type of template is a "layout" drawing template. In the case of a "layout" template, the dimensions of the drawing are defined when it is created and can be updated. In this case, the drawing can be an architectural drawing or any other type of drawing. A template can be defined at the time of creating a drawing. Process of creating a drawing To create a drawing, the drawing template is first created. This drawing template is created as an AutoCAD drawing, which is in DXF format. DXF

stands for Drawing Exchange Format. DXF files can also be created by other drawing software, such as AutoCAD Architect, which also uses a DXF format. However, these files are not compatible with AutoCAD drawings. Once the DXF drawing is created, a sketch of the drawing is drawn freehand, by any tool. After the sketch is complete, the sketch is then saved as a DXF drawing with a name. This DXF file is then imported into a Drawing Template. A Drawing Template is a form (a template) that defines the layout, graphic design, and style of a drawing. Each drawing template has a specific purpose. For example, a Layout Template may be used to create a header or footer in a document. a1d647c40b
