I

have a gradle project that builds code of several sub-projects. When I run the main build task, I want to: Check if the main project contains a resource-resolvable jar If it contains a jar, then get the version from that jar. If the version is not set, then set it to the latest, and run an ant task to fetch the latest version When the latest version is fetched, start build of subprojects. So the building of subprojects is a separate task, but I only want to run it if the main project fails. The subproject-building has to be

atomic, i.e. if there is an error in a subproject, then the error must be passed to the build.gradle of the subprojects to stop them from further execution. The way I'm trying to solve this is to run an ant task inside main task, which will get the latest version of resource-resolvable jar and then build subprojects in build.gradle of the subprojects. The problem is that build fails if the jar is not available, so I'm unable to run that ant task and get the latest version. How can I overcome this problem?

The complete build.gradle for the main project is: apply plugin: 'java' group = 'com.xxx' version = '0.
