I mean with a starter motor, would it be similar to the engine of a conventional car, that when you press the gas it starts the engine by turning the gas valves. In this case, a conventional car starter engine could be like a DC motor. A: Exactly, but instead of fuel there is electricity. See Electrical starter motor. A: The power transferred from the battery to the starter is power in the same sense as the power from the battery to the starter's coils is power. The amount of power transferred depends on the voltage of the battery and the current being delivered to the starter and is called an amp-hour. Conventional starting systems that use batteries as starting

power sources are based on the principle of storing energy in an electrical form in the battery and releasing it by burning it (or letting it charge the battery) to rotate the starter's armature. As a result, the amount of power delivered by a battery to the starter is limited by the amount of electricity that can be stored in the battery. To keep in mind is that they don't have a combustion chamber and hence have no way of burning or converting electricity into fuel.
