Download Asus Zenfone 5 USB Driver from Intel .. 'The current diversity of the brain is not as simple as one might think,' he says. 'It's hugely complex, but different kinds of cells can be far more similar to each other than we think.' The problem is that no two brain cells are the same. We have around 20 billion of each, an impossibly large number, and this means we are unlikely to ever understand how the brain works without that detailed knowledge. A brain-wide map can at least give us a picture of where the wires might be in relation to the centres of action. 'The brain has builtin biases,' says Aboitiz. 'The results that you see in the direction of a sensory response can be different than what people think.' A new way of understanding the brain In the absence of such a map, it is not possible to trace the neurons that activate us when we see something. We can only narrow down the likely neurons by testing people with brain injuries and examining what the results are. In many cases it would be a mistake to call these patients 'neurological' or 'movement' or 'blind' patients. They might appear to be, because they're responding to visual or tactile stimuli that
